

**Docket: CLUTCH-1**

## **MULTI-USE GOLF CLUB HEAD**

### **ABSTRACT OF THE DISCLOSURE**

A utility golf club that combines a number of features not otherwise found in any one standard golf club. A golf club having a short shaft, a heavy head, a strong loft angle, a deep face, a wide sole, a sharp edge sole pattern, an increased lie angle and hitting surface and sightline alignment aids, can be advantageously employed in a variety of difficult game situations. The short shaft aids precision and increases attack angle. The heavy head helps defeat deep rough and permits a shortened back swing. The deep face assures a greater probability of striking the ball even in the rough where the ball may sit very high. A stronger loft angle is useful for bump and run shots near the greens as well as extricating shots out of the rough. The sharp edge sole pattern permits more consistent shots on hard surfaces. The alignment aids permit accurate orientation of the club head particularly near the green where it can be controlled like a putter. In addition, the preferred embodiment of the invention utilizes a high lie angle and a hosel shifted behind the club head's leading edge to reduce turf contact particularly in the rough and thus minimize induced twisting.
